    No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.

RESULT AAY87460 IJ Cholera toxin B/enterotoxin B-derived peptide, SEQ ID NO:2 03-JUL-2000 (first entry) AAY87460 standard; peptide; Williams NA, 07-SEP-1998; 07-SEP-1999; WO200014114-A1 Vibrio cholerae. Escherichia coli. adjuvant; immune Cholera toxin subunit B; CtxB; heat labile enterotoxin subunit B; EtxB; AAY87460; (UYBR-) UNIV BRISTOL. 16-MAR-2000. beta-4-alpha-2 loop; GM-1 ganglioside receptor; Hirst TR; 98GB-0019484 99WO-GB02970 disorder; diarrhoea. 7 ₽ immunomodulation;

Derivatives of Escherichia coli heat labile enterotoxins useful as immunomodulators and for treating diarrhea and which do not bind the glycolipid receptor ${\tt GM-1}$ -

WPI; 2000-256943/22.

```
cc labile enterotoxin (Etx) and its closely related homologue, cholera ct toxin (Ctx) from Vibrio cholerae which do not bind to the ubiquitous composed of one A subunit and five identical B subunits. The A subunit cc is responsible for toxicity, while the B subunits (EtxB and Ctx are ribosyltransferase activity, while the B subunits (EtxB and CtxB) cc facilitate the entry of subunit A into the host cell via the binding and cc cross-linking of GM-1 receptors. Although GM-1 binding is responsible cffects of Etx and Ctx, it has been found that certain cc fifects of the toxins, such as immunomodulation, are not mediated cc through GM-1 binding. The peptides of the invention are fragments of the course for subunits, except that they do not bind or cross link cross in the subunits, except that they do not bind or cross link cff. They may be used in medicine as an immunomodulator or adjuvant. Cc GM-1. They may be used as an inhibitor for toxin-induced diarrhoea. Cc Immune disorder and/or toxin-induced diarrhoea. Sequences AXY87460-Y87463 cc particularly preferred peptides of the invention, AAY87460 being cc particularly preferred.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

```
The invention relates to peptide fragments of the Escherichia coli heat CC labile enterotoxin (Etx) and its closely related homologue, cholera coli toxin (Ctx) from Vibrio cholerae which do not bind to the ubiquitous CC GM-1 ganglioside receptors on host cell surfaces. Both Etx and Ctx are composed of one A subunit and five identical B subunits. The A subunit cc is responsible for toxicity, possessing adenosine diphosphate (ADP) ADP-CC ribosyltransferase activity, while the B subunits (EtxB and CtxB) and cross-linking of GM-1 receptors. Although GM-1 binding is responsible cross-linking of GM-1 receptors. Although GM-1 binding is responsible coross-linking of GM-1 receptors. Although GM-1 binding is responsible coross-linking of the fetx and Ctx, it has been found that certain ceffects of the toxins, such as immunomodulation, are not mediated corosments of the beta-4-alpha-2 loop of EtxB and/or CtxB, exerting the corosments of the beta-4-alpha-2 loop of EtxB and/or CtxB, exerting the composition of the production of a composition for treating, preventing and corosmodulator or adjuvant. They may also be used as an inhibitor for conduction of a composition for treating, preventing and/or modulating a composition of the present invention to assess whether a peptide corresponding to a portion of the beta-4-alpha-2 loop, and peptide AAY87465 is a randomly selected control perfects. Peptide AAY87464 corresponds to residues corresponds to residues beta-4-alpha-2 loop, and peptide AAY87465 is a corresponding selected control perfects.
Sequence
                                                         randomly selected control peptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cc is responsible for toxicity, possessing adenosine diphosphate (ADP) ADP-CC ribosyltransferase activity, while the B subunits (EtxB and CtxB) CC facilitate the entry of subunit A into the host cell via the binding and CC cross-linking of GM-1 receptors. Although GM-1 binding is responsible CC for some of the effects of Etx and Ctx, it has been found that certain CC effects of the toxins, such as immunomodulation, are not mediated CC through GM-1 binding. The peptides of the invention are fragments of the beta-4- alpha-2 loop of EtxB and/or CtxB, exerting the same effects as CC normal EtxB and CtxB subunits, except that they do not bind or cross link CC GM-1. They may be used in medicine as an immunomodulator or adjuvant. CC They may also be used as an inhibitor for toxin-induced diarrhoea. CC for treating, preventing and/or modulating a disease associated with an CC control disorder and/or toxin-induced diarrhoea. Sequences Ax87460-Y87463 crepresent preferred peptides of the invention, Aay87460 being particularly preferred.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

Both Etx and Ctx are composed of one A subunit and five identical B subunits. The A subunit

The DNA sequence encoding this ligates to othersynthetic oligonuclectides to form a new recombinant gene. This encodes a flagellin fusion protein which can be used in vaccines for immur therapy.
                                     A compsn. comprising a conjugate of an antigenic cholera B toxin peptide fragment (e.g. AAR85126-30 and esp. AAR85125), covalently bound to a microparticulate inert carrier (e.g. modified silica c thyroglobulin) can be used as an oral vaccine for immunisation against cholera infection. The inert carrier is insoluble in the digestive tract, allowing presentation of the antigen in the intestines, where it will elicit antibodies mainly of the

 맑
                                                                                                                                                                                   effects of the toxins, such as immunomodulation, are not mediated through GM-1 binding. The peptides of the invention are fragments of the beta-4- alpha-2 loop of EtxB and/or CtxB, exerting the same effects as normal EtxB and CtxB subunits, except that they do not bind or cross link GM-1. They may be used in medicine as an immunomodulator or adjuvant. They may also be used as an inhibitor for toxin-induced diarrhoea. Therefore, the peptides may be used in the production of a composition for treating, preventing and/or modulating a disease associated with an immune disorder and/or toxin-induced diarrhoea. Sequences AAX87460-Y87463 represent preferred peptides of the invention, AAY87460 being particularly preferred.
                                                                                                                                                                                                                                                                                                                                                                               The invention relates to peptide fragments of the Escherichia coli heat labile enterotoxin (Etx) and its closely related homologue, cholera toxin (Ctx) from Vibrio cholera which do not bind to the ubiquitous GM-1 ganglioside receptors on host cell surfaces. Both Etx and Ctx are composed of one A subunit and five identical B subunits. The A subunit is responsible for toxicity, possessing adenosine diphosphate (ADP) ADP-facilitate the entry of subunit the B subunits (EtxB and CtxB) facilitate the entry of subunit A into the host cell via the binding and cross-linking of GM-1 receptors. Although GM-1 binding is responsible for some of the effects of Etx and Ctx, it has been found that certain

                                                                                                                                                                                                                                                                     CC GM-1 ganglioside receptors on host cell surfaces. Both Etx and Ctx are composed of one A subunit and five identical B subunits. The A subunit cis responsible for toxicity, possessing adenosine diphosphate (ADP) ADP-CT ribosyltransferase activity, while the B subunits (EtxB and CtxB) across-linking of GM-1 receptors. Although GM-1 binding is responsible for some of the effects of Etx and Ctx, it has been found that certain ceffects of the toxins, such as immunomodulation, are not mediated through GM-1 binding. The peptides of the invention are fragments of the beta-4- alpha-2 loop of EtxB and/or CtxB, exerting the same effects as cormal EtxB and CtxB subunits, except that they do not bind or cross link GM-1. They may be used in medicine as an immunomodulator or adjuvant. They may also be used as an inhibitor for toxin-induced diarrhoea.

Therefore, the peptides may be used in the production of a composition of immune disorder and/or toxin-induced diarrhoea. Sequences AAY87460-Y87463 represent preferred peptides of the invention, AAY87460 being

                                                                               This sequence is encoded by a fragment of the the plasmid pLPA93

CC which was used in the production of finh fusion genes comprising

Ct the cholera toxin B subunit inserted into the finh gene. This insert

CC shows the inclusion of the B subunit into the finh protein at position

CC 224-226. The chimeric genes were then opt. further modified by insertion

CC of the hepatitis B virus surface antigen pre-S2 region into a different

CC cosition of the Finh adhesin of type 1 fimbriae. Restletion site handles

CC (BglII-sites) were introduced into the finh gene, and the foreign

CC epitopes are then inserted in-frame. In the selected positions the

CC insertion of the epitopes did not significantly alter the adhesive

CC of unction of the Finh protein. The expression of the chimeric proteins

CC on the surface of finbriae on bacterial hosts illustrated the possibility

CC of using bacterial adhesins as general presenters of foreign antigens and

CC epitopes. These chimeric genes may be used in the production of variant

CC Finh adhesins which may be useful for targetting active compounds

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The inventors claim cholera toxin B1 subunit sequences which carry Arg in posn. 35, 67 or 73 (AAP30264, AAP30265, AAP30600). Tests have shown that Arg in posns. 35, 67 and 73 play an important role in fixing these toxins to cell walls. The peptides are used in the treatment of, and vaccination against, cholera infections and animal and human infections due to E. coli (enterotoxin LT). This polypeptide may be used in the vaccination of mammals for protection against the enterotoxins composite polypeptide is made by solid phase synthesis or recombinant DNA techniques. X9 is Met or Lys, X12 is Ala or Glux39 is Asn or Tyr and X46 is Tyr or Asn. See also AAP50439-57.

                                                           The inventors claim cholera toxin B1 subunit sequences which carry Arg in posn. 35, 67 or 73 (AAP30264, AAP30265, AAP30600). Tests have shown that Arg in posns. 35, 67 and 73 play an important role in fixing these toxins to cell walls. The peptides are used in the treatment of, and vaccination against, cholera infections and animal and human infections due to E. coli (enterotoxin LT). The medicament may be
                                                                                                                                                                                    Cholera toxin B, sub-unit polypeptide(s) as vaccines and medicaments - effective against Escherichia coli and Vibrio cholerae infections, are prepd. by solid phase peptide syntlements.

                                                                                                                                                 AAR72540-R72545 are structurally equivalent B-subunits from three ADP-ribosylating toxins, pertussis holotoxtin (FT), E. Coli heat labile toxin (LT), and verotoxin-1 (VT). The structural information obtd. from these comparisons was used to identify sites which contribute to FT's biological activity. By modifying these sites the claimed PT mutants of the invention were produced, they can be used in the development of vaccines against Bordetella

                                                                                                                                                                                                    A method has been developed of producing a modified pertussis holotoxin, convolving analysis of the 3-dimensional form of the crystalline cholotoxin. The pertussis holotoxin modification process comprises:

CC (1) identification of at least one amino acid (aa) residue of the cholotoxin for modification by analysing the 3-dimensional form of the crystalline holotoxin, in relation to known information of the protein crystalline holotoxin, in relation to known information of the protein crystalline holotoxin, in relation to known information of the protein crystalline and clocking a nucleotide sequence encoding at least one (aa)) of a tox operon; and (3) expressing mutant tox box in a Bordetella organism to produce the modified holotoxin. This method is used for modifying contribusing the holotoxin, alters its biological properties.

CC produce the modifying the holotoxin, alters its biological properties.

CC proture. Modifying the holotoxin, alters its biological properties.

CC blotoxin, functional (aa) which affect biological properties of the pertussis holotoxin can be identified. This can be used to predict (aa) which contribute to the toxicity of the holotoxin to produce immunoprotective, genetically-detoxified analogues of pertussis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         22-AUG-1994;

                                                                                                                                                                                                                                              The invention relates to methods of preparing a pertussis holotoxin (PT) CC having a modified biological activity. One method comprises identifying CC at least 1 site in a PT that interacts with a molecule that is capable of CC forming a complex with the holotoxin and which molecule is an effector CC molecule which is an adenine nucleotide and which site contributes to CC toxicity, cell binding or enzymatic activity of PT. The functional CC interacting site(s) are identified by analysing the three dimensional CC identified interacting site(s) are modified to alter toxicity, cell cidentified interacting site(s) are modified to alter toxicity, cell coilogical activity such as toxicity, enzymatic activity, mitogenicity, CC cell binding and adjuvanticity of the PT. The methods can be used to alter a CC toxins such as diphtheria toxin (DT), Pseudomonas exotoxin A (ETA), the CC heat-labile toxin of E. coli (LT) and verotoxin-1 (VT). The present cover contributes the beta-subunit of LT toxin.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DB
